

FAP CLEAN

Diesel additive for DPF regeneration

USES

YACCO FAP CLEAN optimises the regeneration of particulate filters, especially for vehicles used under extreme service conditions (frequent short journeys, low speed, etc.) under which regeneration conditions are not met.

Suitable for all types of particulate filters, except those which already use a regeneration fluid (PSA® technology).

PROPERTIES & ADVANTAGES

- ▶ The organometallic additive allows for soot combustion at a lower temperature, helping to eliminate soot deposits and preventing the DPF from clogging.
- ▶ YACCO FAP CLEAN acts as a catalyst, improving the speed of soot combustion and facilitating the regeneration of the DPF under any service conditions.
- ▶ The use of such fluid is most required in service conditions under which quick and full regeneration is not possible (short journeys, low speed, city traffic, etc.).
- ▶ Improved combustion protects the DPF by preventing the system from overheating. This prolongs the DPF's lifespan and keeps it working at optimal performance.
- ▶ Lower exhaust emissions generated by long, abnormal regeneration of the DPF, thus protecting the engine oil from excessive pollution.
- ▶ This concentrated fluid is easy to use. Simply pour the dose in the diesel tank.

PRECAUTIONS FOR USE

Before refueling, pour in one dose of YACCO FAP CLEAN for 50 to 60L of diesel.

For less than 25L of diesel, reduce the amount of FAP CLEAN accordingly to avoid using too much.

Use FAP CLEAN once every 3 or 4 refueling.
